Coacheey website field study

Haytam CHARAFI | 2303060049
SFWE475 / CPRG201 - Assignment 2

Website: https://coacheey.com/ | Organisation/brand: Coacheey
Prepared: 10 November 2026 | Tier: Core review draft

Review status and scope

This study concerns public coach discovery and event browsing. Evidence consists of screenshots supplied by the student and student-exported Lighthouse reports. Chrome DevTools was used; the fieldwork browser version and most original capture timestamps were not recorded. The homepage Lighthouse export records 9 November 2026 at 11:15:54.972 UTC. This is not a timestamp for other screenshots.

AI assisted with organising supplied evidence, explaining results, drafting and PDF layout. This review copy requires the student to verify the interpretations and revise the wording before submission. Missing checks are stated rather than presented as completed. Optional benchmark and partial usability records are separate; Challenge implementation/verification assistance is disclosed in fix/README.md.

Part A - Under the hood

A1 - HTTPS and certificate

The supplied redirect and certificate captures support an HTTP entry ending on HTTPS and a valid certificate in Chrome. HTTPS protects the connection; it does not establish that every part of the service is trustworthy. The redirect chain and certificate validity dates were not transcribed, and some address bars hide the scheme. [A1]

A2 - URL structure

Five captured paths are assessed below. All use lowercase and have no underscores. Four have no query parameters; the coaches URL has two useful filters but long UUID values. HTTPS is explicit for Events in the Lighthouse result; the full schemes of the other four captured addresses need confirmation. No authentication attempt is part of this assessment. [A2]

Captured path	HTTPS	Readable	Lowercase	Hyphens / no _	Few queries
/public-sessions	Pass	Pass	Pass	Pass	Pass (0)
/coaches?city=<UUID>&sport=<UUID>	Unverified	Fail: long IDs	Pass	Pass	Pass (2)
/auth	Unverified	Pass; technical	Pass	Pass	Pass (0)
/coach/bee-mindful-3b6ad569	Unverified	Pass	Pass	Pass	Pass (0)
/for-coaches	Unverified	Pass	Pass	Pass	Pass (0)

The appendix retains the exact captured filtered-coaches address. UUID abbreviations above are for table readability, not substitute evidence.

Part A - Requests and caching

A3 - Document and data requests

The homepage document request is GET https://coacheey.com/, returning 200 OK with Content-Type text/html; charset=utf-8. One overview capture shows 131 requests, 337 kB transferred and 7.2 MB resources, with No throttling and browser caching enabled. These are one-session totals, not a repeatable cold-load benchmark: cached resources explain part of the difference between transferred bytes and resource size. A separate Fetch/XHR capture shows a GET to public_coach_profiles returning 200, supporting browser-side retrieval of coach data; its full query is not transcribed here. [A3]

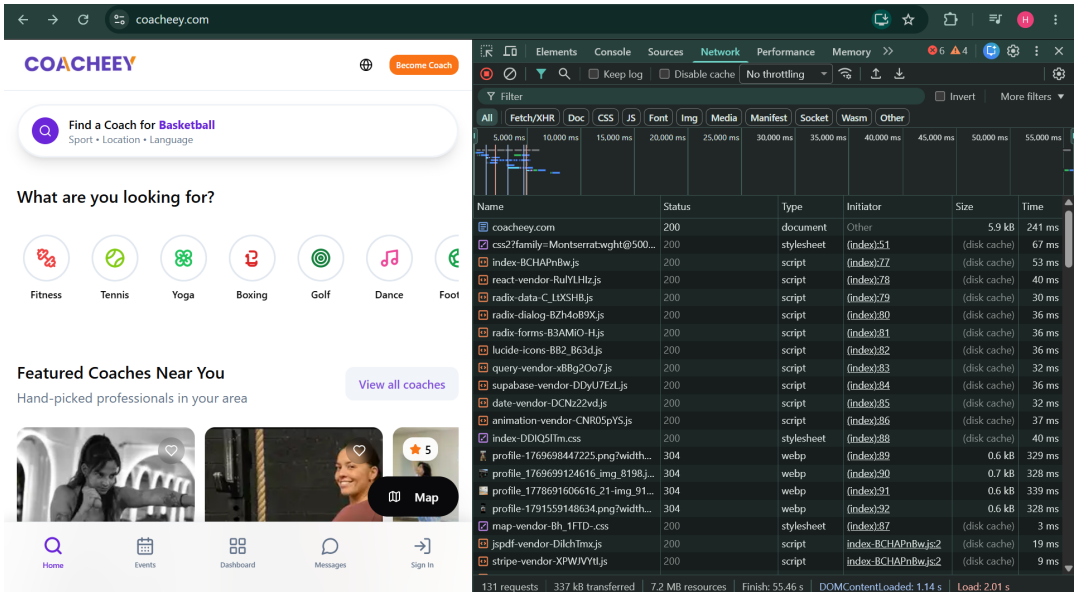

Figure 1. A3: complete Network overview capture. Request totals apply to this capture only.

A4 - Missing-page response

The made-up path /no-such-page-123 displays "404", "Oops! Page not found" and "Return to Home", but its fresh document response is 200 with Disable cache checked. This is a soft 404: visitors see a missing-page message while software receives a success status. The recovery link is helpful, but the HTTP status should agree with the page. The separate cached 304 capture is supporting context, not the fresh-response result. [A4]

A5 - Cache policies

The main document has Cache-Control: no-cache. It may be stored but must be revalidated before reuse. The inspected JavaScript asset has Cache-Control: public, max-age=31536000, immutable, allowing shared/browser caching for one year without routine freshness revalidation while fresh. This can reduce repeat transfers; changed long-lived assets should use a new URL. The asset header is visible, but its complete request URL was not captured in the supplied header view. [A5]

Part A - Rendering and metadata

A6 - Initial HTML and live content

The raw source includes "Find Your Perfect Coach in Luxembourg", descriptive text and links. The live Elements capture instead shows the hero heading "Find Your Perfect Coach" with different surrounding markup. This supports a mixed delivery model: substantive initial HTML plus browser-side modification. It does not distinguish runtime server rendering from static prerendering, and script filenames alone do not establish the rendering method. [A6]

A7 - SEO basics

The source includes a descriptive title and description, a homepage canonical URL and lang=en. The live heading search shows one h1. A source/live title difference is recorded without assuming its cause. No anchors matching sponsored or ugc were found in the inspected DOM; that absence alone is not a defect, because the applicability and type of advertising or user content need checking. [A7]

Item	Observed value / limitation
Source title	Find Your Sport Coach in Luxembourg - 50+ Sports | Coacheey
Live title	Sport Coaches in Luxembourg | Find Your Perfect Trainer
Description	Find certified sport coaches in Luxembourg. Tennis, yoga, fitness, boxing & 50+ sports. Book online from EUR20/session.
Canonical / language	https://coacheey.com/ ; en
h1	One live h1: Find Your Perfect Coach. Count screenshot has a cropped address bar.
sponsored / ugc	0 matching anchors in inspected DOM; relevance not fully established.

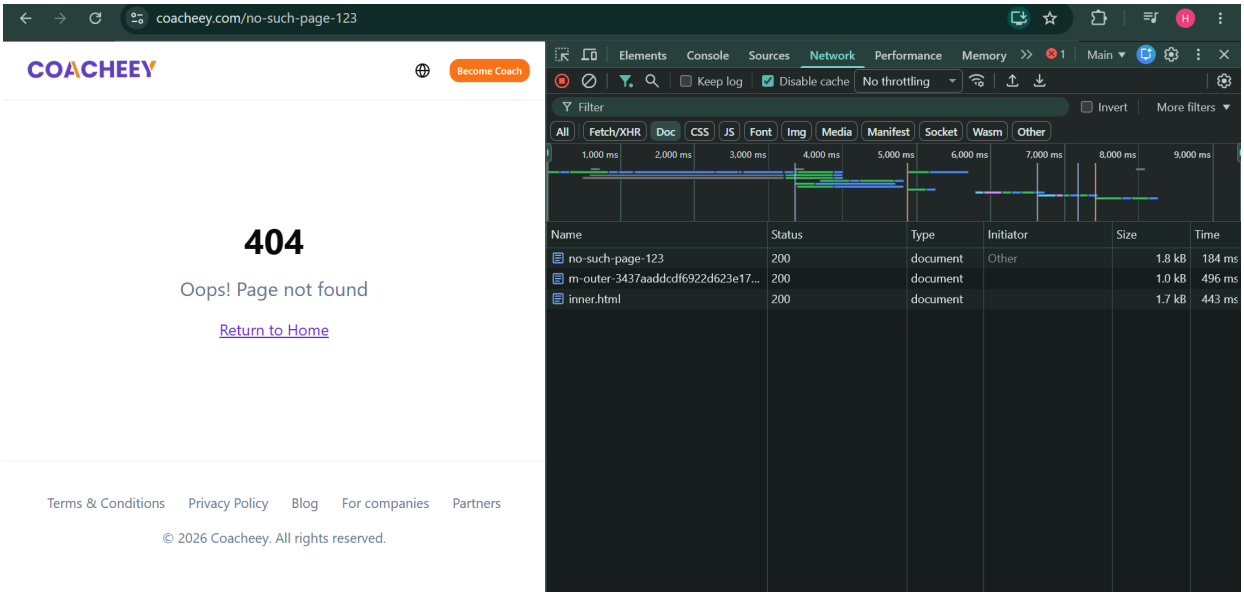

Figure 2. A4: missing-page message alongside fresh HTTP 200. Original screenshot retained without alteration.

Part B - Loading, empty and offline states

B1 - Loading feedback

With the actual Chrome preset labelled 3G and Disable cache unchecked, the MEC Movement profile first shows image, avatar and text skeletons, then populated coach information. The student confirmed both MEC screenshots came from one reload. The document returned 304, indicating cache revalidation. The placeholders give visible structure while content arrives. Elapsed capture times were not recorded, so this is qualitative sequence evidence, not a timed Slow 3G or cold-load speed measurement. [B1]

B2 - Empty results

On Events, searching zzzqqq returns "0 events found", "No events found" and "Try adjusting your search criteria or location filter." This identifies the empty state and suggests recovery. However, the same capture retains "$62 avg", "Most popular: Fitness" and "4 top-rated". Their scope is unclear when zero events match, so these statistics could confuse visitors; no calculation error is claimed. [B2]

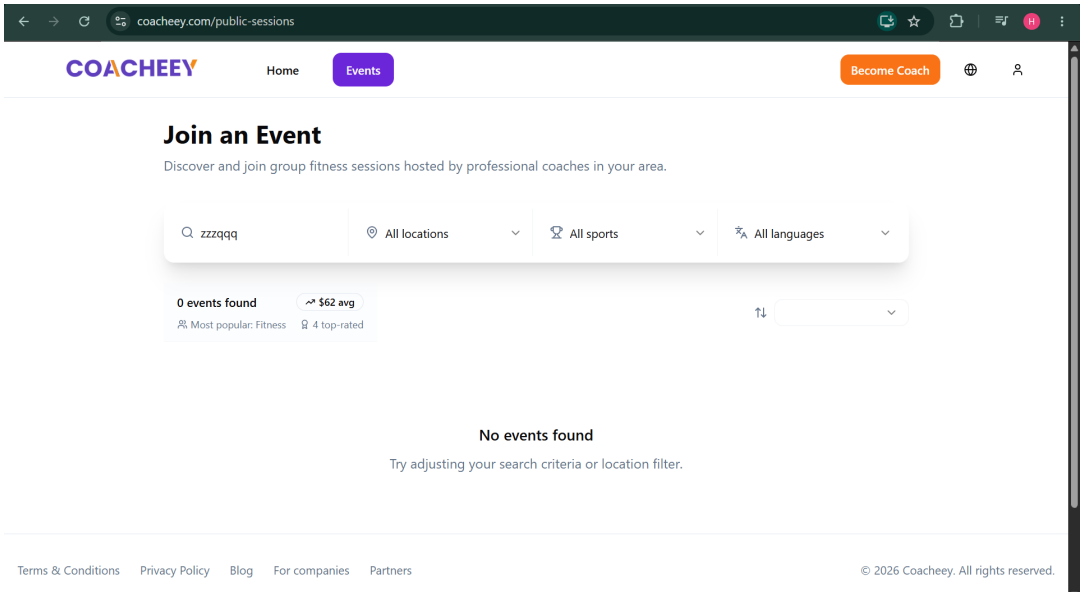

Figure 3. B2: impossible query, clear recovery advice and still-visible summary statistics.

B3 - Offline reload

Reloading Events with Network set to Offline produces Chrome's dinosaur page and ERR_INTERNET_DISCONNECTED, with failed/cancelled document requests. The advice belongs to the browser, not Coacheey; no site-specific retry control is visible. This establishes full-page offline behaviour only, not how an already loaded search handles a lost connection. Later site/Lighthouse captures show online activity resumed, although the exact restoration step was not recorded. [B3]

Part B - Forms, keyboard and accessibility

B4 - Safe validation limitation

The student reported no public contact section was found. No suitable public form was identified for deliberately incomplete submission testing. Login, registration and booking actions were avoided. Result: not tested safely; no claim is made about validation errors or input retention. This is an incomplete check, not evidence that the site has no forms. [B4]

B5 - Labels and accessible names

The Events search box has no separate visible label; Chrome derives its name "Search sessions..." from the placeholder. Location, sport and language expose role combobox but have empty computed Name fields and no associated label specified. Values such as "All locations" and "Pilates" do not substitute for a stable name identifying purpose. The language detail is cropped and relies on the student's inspection context. The header globe is separately named "Change language". Sort and label click-to-focus remain unverified; no complete field-by-field pass is claimed. [B5]

B6 - Keyboard task

The student reached Events using Tab and Enter with visible focus, reported the header order logo, Home, Events, Become Coach, and encountered no trap. No skip link appeared in this attempt. Tab skipped the sport icons beneath "What are you looking for?", while clicking Yoga with the mouse opened results. This supports a keyboard-accessibility obstacle for those discovery shortcuts in the tested state, despite successful header navigation. DOM semantics and alternative routes were not inspected; no site-wide pass or failure is claimed. [B6]

B7 - Lighthouse Accessibility

The homepage scored 94 and Events scored 93. Both student-exported HTML reports confirm Accessibility-only desktop formFactor with screen emulation disabled. The homepage audit ran at 2026-11-09 11:15:54.972 UTC; the Events export ran at 11:42:54.478 UTC that day, a separate run from its earlier screenshot. Exported results flag insufficient colour contrast and a missing main landmark on both pages, plus non-sequential heading order on Events. These can affect reading and navigation. Automated scores cover only a subset of accessibility and do not override the manual label findings. [B7]

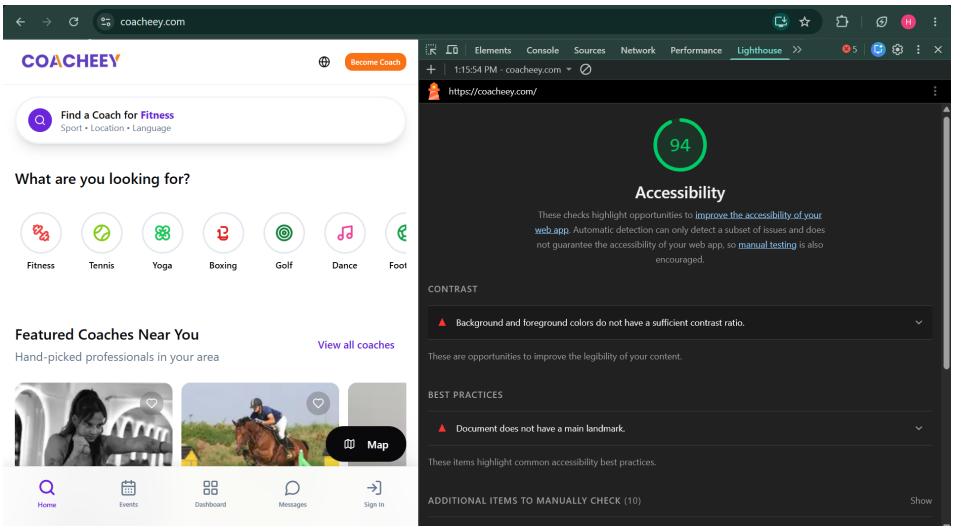

Figure 4. B7: homepage score 94, with contrast and main-landmark flags. Events screenshot and homepage HTML are in evidence/.

B8 - Control wording

An Events card uses "Read more", which is less specific than the event title; a contextual label such as "Read about this Pilates event" would identify its destination more clearly. The location and sport selectors also need stable accessible names such as "Filter by location" and "Filter by sport" while keeping their current values. These are three supported examples; other icons were not classified as unnamed without inspection. [B8; B5]

Part C - What to keep and fix first

Two strengths

1. Useful recovery from no matches. Events explains that no events were found and suggests adjusting the search, helping visitors recover rather than leaving a blank area. [B2]

2. Visible loading structure. Coach-profile skeletons show where images and details will appear, giving visitors feedback while content arrives. This is a usability strength, not a verified loading-speed claim. [B1]

Priority order: first make essential search filters identifiable, then improve readability of shared content, and finally align missing-page status with its message. This favours barriers to the main visitor task before a technical correctness issue.

1 - Give search filters stable names

Problem: the inspected location and sport comboboxes have empty computed names. **Evidence:** B5-location-accessibility.png and B5-sport-accessibility.png. **Affected visitors:** people using assistive technology to find suitable sessions. **Fix:** add persistent visible labels connected to the controls, preserving selected values; review language and sorting too. **Effort: low** (estimate: local labelling changes). **Impact: high** (estimate: essential search controls become easier to identify). Verify through the accessibility tree and manual keyboard/screen-reader use. [B5]

2 - Improve text contrast

Problem: Lighthouse flags insufficient foreground/background contrast on both inspected pages. **Evidence:** B7-lighthouse-home.html and B7-lighthouse-inner.png. **Affected visitors:** people with low vision and visitors viewing the site in glare. **Fix:** inspect the flagged elements and adjust shared text/background colours while preserving focus visibility. **Effort: medium** (estimate: shared styles need checking across states). **Impact: high** (estimate: reading is fundamental across pages). Rerun both audits and inspect the affected text manually; scores alone are not the acceptance criterion. [B7]

3 - Return the correct missing-page status

Problem: an invented page displays a missing-page message but returns HTTP 200. **Evidence:** A4-status-fresh.png. **Affected visitors:** people following broken links, and services checking or indexing those links. **Fix:** keep the friendly message and home link but return HTTP 404 for nonexistent routes. **Effort: medium** (estimate: hosting/routing configuration needs verification). **Impact: medium** (estimate: improves broken-link detection and indexing signals). Revisit the same invented URL with caching disabled and confirm 404 in Network. [A4]

Remaining submission work

Review and rewrite this AI-assisted draft; confirm eligibility, genuine site use and LMS claim; complete missing audit metadata and any omitted checks; verify four meaningful commits across three genuine days and merge into main. Both Lighthouse exports are now present. No backdated work or complete-mark claim is implied. Repository access must respect the course-only report rule.

Appendix - Evidence log

One row per included evidence file. Original screenshots remain in evidence/. Most capture dates/times and the browser version were not recorded; filesystem modification times and HTTP Date headers are not treated as capture timestamps. Unknown metadata is stated explicitly. Source screenshots are student-supplied; AI-generated reference captures outside the project are excluded.
