Website review for Coacheey

Haytam CHARAFI | 10 November 2026

AI-assisted draft for student review. Based on the recorded public-page checks.

What is working well

Clear search recovery. Events explains when a search finds nothing and suggests adjusting the criteria.

Visible loading feedback. Coach profiles show placeholders while their details load, so visitors can see that content is on its way. Both are useful touches to keep.

Three things to fix first

1. Make finding a session work without a mouse.

The keyboard test could open Events, but it skipped the sport shortcuts that worked with a mouse. The location, sport and language filters also lacked names explaining their purpose to reading software. Some visitors may struggle to reach a suitable session or leave before finding one. Ask your developer to make the shortcuts work from the keyboard and give every filter a clear, permanent label.

Check: use Tab to reach Yoga and press Enter. It should open the same results as a mouse click. Ask the developer to demonstrate that reading software announces each filter's purpose as well as its selected value.

2. Make the lighter text easier to read.

The browser checks flagged weak text/background contrast on the home and Events pages. People with low vision or using the site in bright light may miss details they need to choose a session. Ask your developer to identify the flagged text and adjust its colours, including when a control is selected or focused.

Check: revisit the affected text on both pages and repeat the same browser accessibility check. The contrast warnings for those elements should be gone; a higher overall score alone is not enough.

3. Keep the helpful missing-page screen, but correct its response.

An invented address shows a useful missing-page message and home link, but the website reports success behind the scenes. That can confuse search engines and broken-link checks. Ask your developer to send a proper "not found" response while preserving the recovery page.

Check: open /no-such-page-123 and use its home link. The developer should also show that this address returns "404 - not found", rather than a success response.

The order puts access to the main visitor task first, followed by readability and then missing-page handling. Thank you for making coaches and group activities easier to discover.
