S2 - One-participant usability review

Haytam CHARAFI | 2303060049 | Prepared 10 November 2026

Participant and session

P1 is a friend who is not a computing student. The session record gives 6 November 2026, a laptop and approximately ten minutes of browsing. Browser, exact time and timezone were not recorded. The task outcomes were provided retrospectively, and it has not been confirmed whether all three came from that session or a later follow-up. Think-aloud instructions and observation without assistance were not documented; this is therefore a partial usability record.

Task	Recorded outcome	Timing / hesitation
Find a Pilates event's location and price	Kirchberg; EUR15.	Not recorded / not recorded
Find a coach's sports and rating/review information	MEC MOVEMENT; Yoga and Pilates. The initial answer was 0 stars. The later profile capture displays 0 (0), indicating no displayed reviews rather than evidence of an actual zero-star review.	Not recorded / not recorded
Search zzzqqq, then recover to results	No events found; successful return to an event list was confirmed.	Not recorded / not recorded

Follow-up feedback

The general reaction was described as cool, easy to use and understandable. In a later clarification, the student also reported that P1 said there was no problem with the website. This is a positive overall reaction, not a record of task timings or a statement that every feature was tested.

What was the most frustrating moment? The wording relayed was "the app was working as it should be working". This was not transcribed during the session, so it is presented as a relayed answer rather than a contemporaneous quote.

What would you change first? No changes were suggested, according to the supplied account. An exact original transcript was not recorded. No extra frustration or improvement request has been reconstructed.

What this adds to Core

The reported recovery from an empty search agrees with B2: the message explains the result and suggests changing the criteria. P1's positive feedback does not rule out the B5/B6 keyboard and labelling problems. The notes do not say that he used only a keyboard or assistive technology, so his test did not specifically check those barriers. His experience is useful feedback from one person, rather than proof that all visitors will have the same experience.

What is still missing

Individual task times, hesitation observations and a documented procedure are needed for a complete S2 study. The session chronology also needs confirmation. A new observed session could collect those details, but it would need its own real date and notes; the missing measurements cannot be added retrospectively. AI assisted the structure and wording of this draft, using only the supplied session account and existing site evidence.
